### Product Specific Information

Anti-Pan-Methyl-Histone H3 (Lys9) Polyclonal Antibody PA5-16184 has been tested and validated in use for Western Blot, Immunoprecipitation, Immunofluorescence, and ChIP applications.

A molecular weight of approximately 17 kDa is expected.

### General Information

Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Two molecules of each of the four core histones (H2A, H2B, H3, and H4) form an octamer, around which approximately 146 bp of DNA is wrapped in repeating units, called nucleosomes. The linker histone, H1, interacts with linker DNA between nucleosomes and functions in the compaction of chromatin into higher order structures. This gene is intronless and encodes a member of the histone H3 family. Transcripts from this gene lack polyA tails but instead contain a palindromic termination element. This gene is found in the large histone gene cluster on chromosome 6.
